MONTHLY CLIMATOLOGICAL SUMMARIES for MAURITIUS, RODRIGUES AND OUTER ISLANDS

1. INTRODUCTION

Mauritius lies between Latitudes 19°58.8' and 20°31.7' South and Longitudes 57°18.0' and 57°46.5' East. Rodrigues lies between Latitudes 19°40' and 19°46' South and Longitudes 63°20' and 63°30' East about 650 km East of Mauritius. St. Brandon is a coral atoll situated around Latitude 16°27' South and Longitude 59°37' East about 450 km to the North-North-East of Mauritius. Agalega consists of two small islands between Latitudes 10°20' and 10°29' South and Longitudes 56°34' and 56°42' East, about 1050 km almost North of Mauritius.

Monthly climatological data presented in this issue are based on daily observations of various meteorological parameters recorded in Mauritius, Rodrigues, St. Brandon and Agalega.

2. STATIONS

Synoptic Stations

Synoptic stations are meteorological weather observing centres where all meteorological parameters are being monitored at fixed intervals of time and their observations are exchanged on the Global Telecommunication System of the World Meteorological Organisation.

The Mauritius Meteorological Services maintains six synoptic stations :

Vacoas (20°18'S, 57°30'E) WMO Station number 61995, and Plaisance (20°26'S, 57°41'E) WMO Station number 61990, in Mauritius. Pointe Canon (19°41'S, 63°25'E) WMO Station number 61988 and Plaine Corail (19°41'S , 63°45'E) WMO Station number 61989, in Rodrigues. Raphael Island, located at 16°27'S and 59°37'E WMO Station number 61986, in St Brandon. Agalega located at 10°21'S 56°35'E, WMO Station number 61974, in North Island.

Climatological Stations

Ordinary climatological stations are stations where climate parameters such as extreme temperatures and amount of precipitation are recorded and including, if possible, some other elements like atmospheric pressure, humidity, soil temperatures, sunshine and wind are monitored daily for the preparation of climatology. The Mauritius Meteorological Services has a network of 22 ordinary climatological stations in Mauritius.

Agrometeorological Stations

The agrometeorological stations monitor standard climatological data that are of interest to agriculture, livestock breeding and forestry. These stations monitor the following parameters, evaporation, humidity, rainfall, sunshine duration, temperature and wind.

The Mauritius Sugar Industry Research Institute manages four such stations in Mauritius with the assistance of the Meteorological Services. Savannah Sugar Estate maintains another station at La Baraque.

3. INSTRUMENTS IN USE AT METEOROLOGICAL STATIONS:

Raingauges

Ordinary raingauges with outer rim of diameter 11.28 cm together with ordinary laboratory cylinders graduated in cubic centimeters are being used to measure rainfall at most stations. Readings are taken at 0700 hours daily. Fourteen stations are equipped with rain recorders, which provide rainfall intensities.

Thermometers and Hygrometers

Ordinary thermometers are used to measure dry, wet bulb and soil temperatures. Maximum and Minimum temperatures are measured by appropriate thermometers. Thermohygrographs have been installed at eight stations.

Anemometers

Nine Dines anemometers provide wind data at the following sites in Mauritius: Digue Seche, FUEL, Medine, Mon Desert Alma, Pamplemousses, Plaisance, Port Louis Harbour Radio, Quatre Bornes and Vacoas. There is also one Dines anemometer at Pointe Canon in Rodrigues. Wind at Agalega is measured by a cup anemometer.

Sunshine Recorders

Campbell Stokes sunshine recorders have been installed at twenty-one sites in Mauritius. Two stations at Rodrigues and one at Agalega are also in operations.

Evaporation Pans

Modified US Class A pans are used to measure daily evaporation amount at 13 stations in Mauritius and one station, Pointe Canon, in Rodrigues.

Barometers

Mercury barometers, digital barometers and aneroid barographs are used at all synoptic stations to measure atmospheric pressure.

Tide Gauges

Sea level is monitored using floating type gauges at Port Louis and Port Mathurin.

Wind Finding Radars

Upper Air observations are carried out daily at Vacoas and Pointe Canon using WF33 radars. At Agalega and St. Brandon, upper air wind observations are made using a theodolite - an optical instrument.

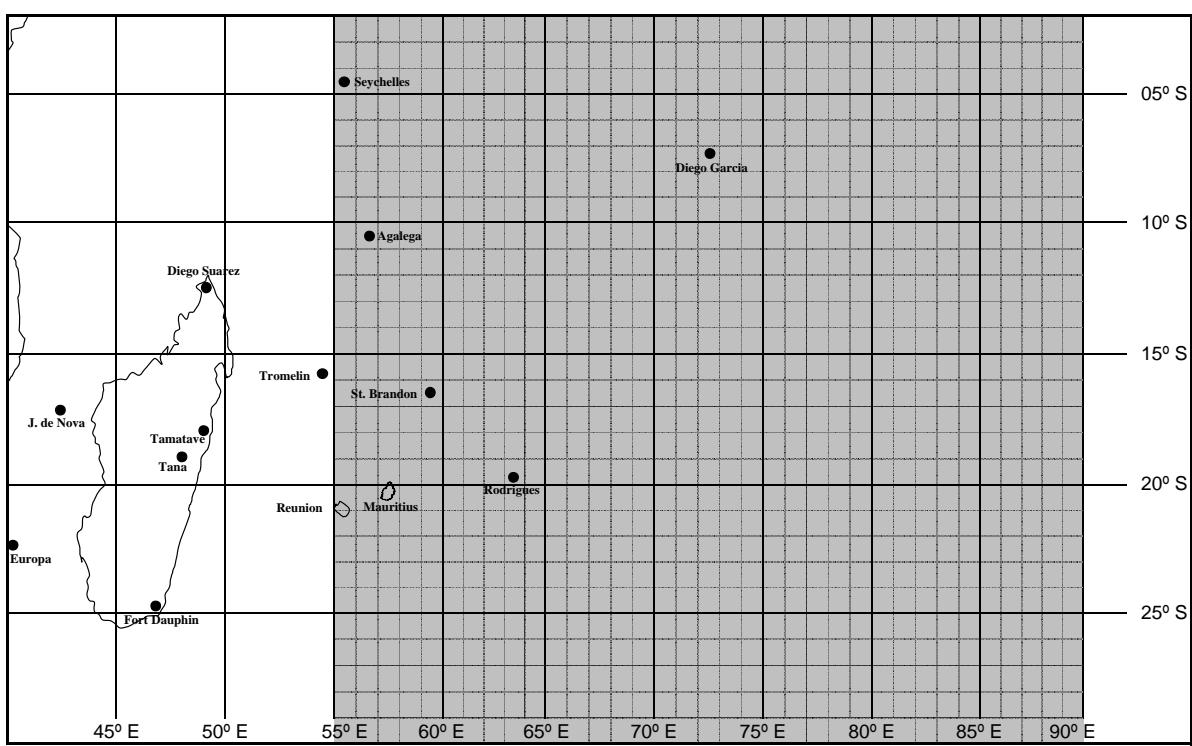

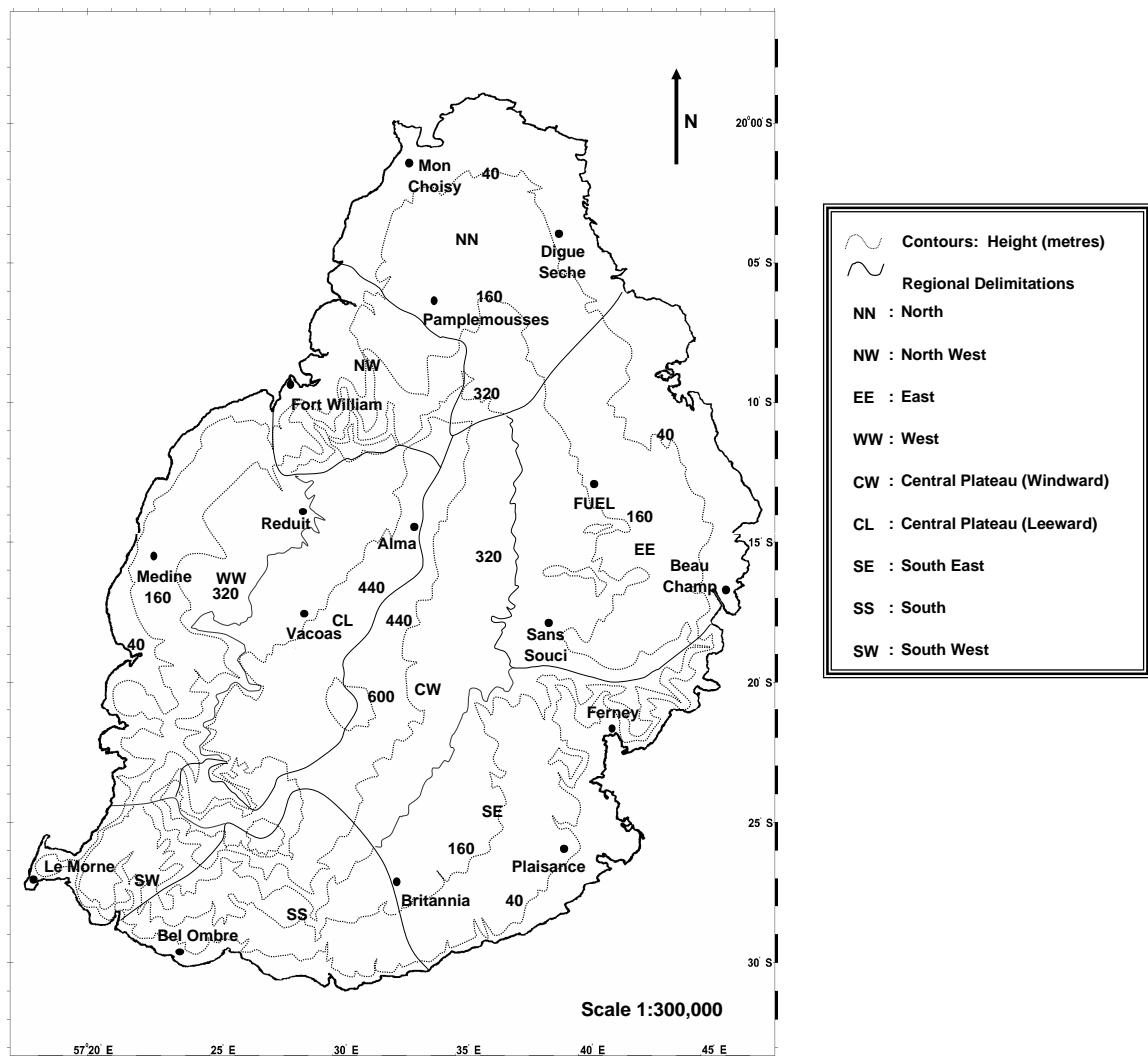

Automatic Weather Stations

22 automatic weather stations have been installed at different sites over the island. There are also two stations in Rodrigues. Weather parameters observed by these automatic weather stations are : humidity, rainfall, temperature and wind.

4. METEOROLOGICAL SUMMARIES

Monthly summaries of meteorological observations in the form of mean totals, extreme values with date of occurrence and departure from long term mean are presented in this issue for various climate parameters of stations located in Mauritius, Rodrigues and the Outer Islands.

WEATHER SUMMARY - May 2008

Convective activity remained weak in the equatorial region all throughout the month. The few ragged convective cloud clusters observed were unorganized and shortlived.

The light wind conditions which prevailed over the Mascarenes during the first three weeks were conducive to the formation of sporadic localized thunderstorms. Worthy to note, is the funnel cloud observed in the afternoon at Phoenix on the Central Plateau, on May 2.

Atmospheric conditions became very unstable in the period 14 to 19 May. Two zones of unsettled weather crossed the island. The first one developed to the south west of Reunion on May 13. Active clouds associated to the system triggered frequent thunderstorms and lightning which illuminated the sky for hours in the evening. The next day it crossed Mauritius causing widespread thundery showers and hail in few regions. The electricity network was damaged as the electric storm struck one of the main power supply lines.

Very soon afterwards, another zone of unsettled weather developed between Mauritius and Rodrigues. It influenced the weather from 16 to 18 May, causing widespread heavy rain and thunderstorms all over the island. For e.g Arnaud and Plaisance recorded 310 mm and 192 mm of rainfall respectively over the 3 day period.

After the passage of a cold front on May 24 Mauritius came under the influence of cold and windy weather due to the anticyclone to the south of the mascarenes. A drop of 2 to 4 degrees Celsius in temperature was noted all through the island. This was infact the very first surge of cold air indicative of an early onset of winter 2008.

Temperature both minimum and maximum was close to average at Mauritius and Rodrigues. The minimum at St Brandon and Agalega were close to the average. It is to be noted that on certain nights due to the calm conditions and clear skies the minimum dropped by 3 to 5 degrees below the long term average. A minimum temperature of 9.7°C was recorded by the automatic weather station at Arnaud on May 27.

Total rainfall over Mauritius for the month was well above the long term mean 180%. Rainfall at St Brandon was close to average. However the second fortnight of May was very dry with rainfall amounting only to 7% of the long term mean.

Rainfall at Agalega was well above the long term mean 160%. Rodrigues saw a very wet month with as much as 201% of the long term mean rainfall at Pointe Canon.

Mean sea level pressure was slightly above average at Mauritius and Agalega, close to normal at St Brandon but below average at Rodrigues.

Mean Rainfall over Mauritius : 298.8 mm

Percentage Rainfall of Long Term Mean : 188 %

After a very dry April, it eventually rained quite significantly and May 2008 turned out to be very wet with a mean rainfall of 299 mm over Mauritius representing 188% of the long term mean 1971-2000.

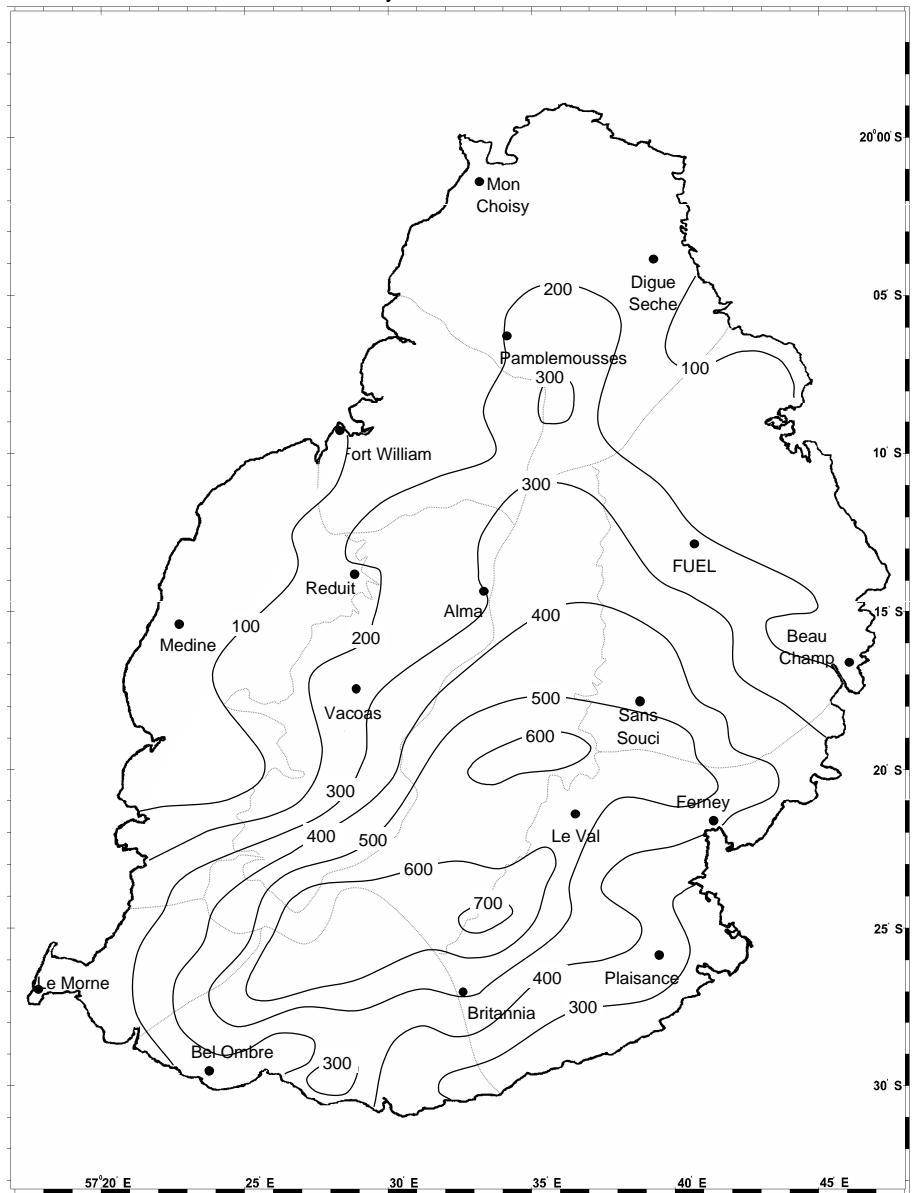

However, the first week was mainly dry followed by 4 rainfall episodes namely 08-12, 14-20, 23-24, and 29-31.

The second rainy episode was the most significant one where two active cold fronts crossed the island on the 16 and the 19. Afterwards, easterly waves coupled with a very unstable atmosphere contributed significantly to the bulk of precipitation. Over some regions of the island, particularly to the south and over the central plateau, moderate showers were frequent. There were even reports of thunder / lightning on the 14, 16 and 18 with water accumulation that affected crops in certain areas.

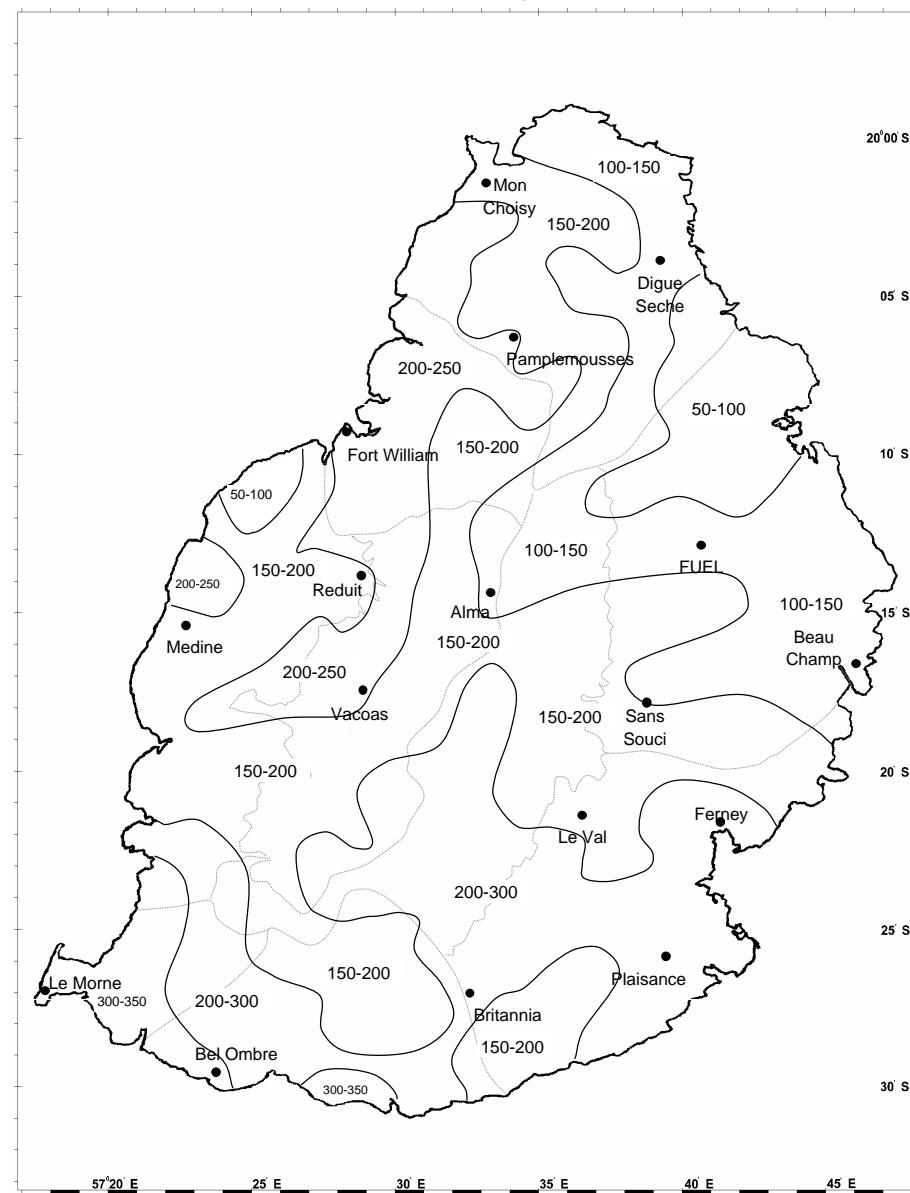

Actually the first half of May had only a mean rainfall of 58 mm representing 36 % of the LTM and the second half had a mean of 228 mm representing 144% of the LTM. Overall, all regions of the island had above normal precipitation with the windward side of the central plateau recording the highest amount namely 492 mm. However, the southwest had the highest percentage of rainfall, that is 273%.
